

# Package ‘dmbc’

August 1, 2020

**Type** Package

**Title** Model Based Clustering of Binary Dissimilarity Measurements

**Version** 0.4.0

**Date** 2020-08-01

**Description** Functions for fitting a Bayesian model for grouping binary dissimilarity matrices in homogeneous clusters. Currently, it includes methods only for binary data.

**Author** Sergio Venturini [aut, cre],  
Raffaella Piccarreta [ctb]

**Maintainer** Sergio Venturini <sergio.venturini@unito.it>

**License** GPL (>= 2)

**NeedsCompilation** yes

**Repository** CRAN

**LazyData** TRUE

**Imports** abind, bayesplot (>= 1.7.0), coda (>= 0.19-3), ggplot2 (>= 3.2.1), ggrepel (>= 0.8.1), graphics, MCMCpack (>= 1.4-4), modeltools (>= 0.2-22), parallel (>= 3.6.1), pcaPP (>= 1.9-73), robustbase (>= 0.93-5), stats4 (>= 3.6.0), tools

dmhc-package

*Model-Based Clustering of Several Dissimilarity Matrices.*

---

## Description

The **dmhc** package implements a Bayesian algorithm for clustering a set of dissimilarity matrices within a model-based framework. In particular, we consider the case where  $S$  matrices are available, each describing the dissimilarities among  $n$  objects, possibly expressed by  $S$  subjects (judges), or measured under different experimental conditions, or with reference to different characteristics of the objects themselves. Specifically, we focus on binary dissimilarities, taking values 0 or 1 depending on whether or not two objects are deemed as similar, with the goal of analyzing such data using multidimensional scaling (MDS). Differently from the standard MDS algorithms, we are interested in partitioning the dissimilarity matrices into clusters and, simultaneously, to extract a specific MDS configuration for each cluster. The parameter estimates are derived using a hybrid Metropolis-Gibbs Markov Chain Monte Carlo algorithm. We also include a BIC-like criterion for jointly selecting the optimal number of clusters and latent space dimensions.

For efficiency reasons, the core computations in the package are implemented using the C programming language and the **RcppArmadillo** package.

The **dmhc** package also supports the simulation of multiple chains through the support of the **parallel** package.

Plotting functionalities are imported from the nice **bayesplot** package. Currently, the package includes methods for binary data only. In future releases routines will be added specifically for continuous (i.e. normal), multinomial and count data.

## dmhc classes

The **dmhc** package defines the following new classes:

- **dmhc\_data**: defines the data to use in a DMBC model.

- `dmbc_model`: defines a DMBC model.
- `dmbc_fit`: defines the results of a DMBC analysis for a single MCMC chain.
- `dmbc_fit_list`: defines the results of a DMBC analysis for multiple MCMC chains.
- `dmbc_ic`: defines the results of the computation of the information criterion for a DMBC analysis.
- `dmbc_config`: defines the estimate of the latent configuration for a DMBC analysis.

The package includes `print`, `summary` and `plot` methods for each one of these classes.

## Resources

- **Bug reports:** If you have noticed a bug that needs to be fixed, please let us know at the `dmbc` issue tracker on GitHub:  
<https://github.com/sergioventurini/dmbc/issues/>.
- **General questions and help:** To ask a question about `dmbc` send and email to:  
`<sergio.venturini@unito.it>`.

## See Also

- `theme_default` for the default ggplot theme used by `bayesplot`.  
`bayesplot-colors` to set or view the color scheme used for plotting with `bayesplot`.  
`ggsave` in `ggplot2` for saving plots.

`adjust_x`

*Adjustment of the center and orientation of a latent configuration.*

## Description

`adjust_x` adjusts the center and orientation of a latent configuration in Bayesian (metric) multidimensional scaling (MDS).

## Usage

`adjust_x(x)`

## Arguments

`x` Numeric matrix containing the latent configuration.

**Value**

A list with elements:

- x A real matrix containing the adjusted latent configuration.
- Sig\_x The variance and covariance matrix of the adjusted latent configuration.

**Author(s)**

Sergio Venturini <sergio.venturini@unito.it>

**See Also**

[bmds](#) for (one-way) Bayesian (metric) multidimensional scaling.

**Examples**

```
n <- 100
nr <- 20
nc <- floor(n/nr)
x <- matrix(rnorm(1:n), nrow = nr, ncol = nc)
adj_x <- adjust_x(x)
adj_x$x
adj_x$Sig_x
```

---

animals

*List of binary dissimilarity matrices among 18 animals.*

---

**Description**

To illustrate the MDS analysis of sorting data, Takane et al. (2009) refer to judgments on the similarity between  $n = 18$  animals expressed by  $S = 20$  subjects. Each subject was asked to divide the animals into as many groups as needed, based on their similarity. We converted these values to 0 or 1 depending on whether a pair of animals is placed or not in the same group by a subject.

**Usage**

```
data(animals)
```

**Format**

A [dmbc\\_data](#) object whose diss element is a list of 20 binary dissimilarity matrices. Each matrix is defined as a dist object measuring whether each pair of the 18 animals has is placed in the same group (1) or not (0).

The dist objects have rows and columns that are named as follows:

**be** bear

**cm** camel

**ct** cat  
**cw** cow  
**dg** dog  
**el** elephant  
**gf** giraffe  
**fx** fox  
**hs** horse  
**li** lion  
**mk** monkey  
**ms** mouse  
**pg** pig  
**rb** rabbit  
**sh** sheep  
**sq** squirrel  
**tg** tiger  
**wf** wolf

## References

## Examples

```
data(animals)
library(bayesplot)
cols <- color_scheme_set("teal")
plot(animals, colors = unlist(cols)[c(1, 6)], font = 1, cex.font = 0.75)
```

**bmds**

*Bayesian multidimensional scaling (BMDS) using Markov Chain Monte Carlo (MCMC).*

## Description

**bmds** computes the Bayesian multidimensional scaling (BMDS) solutions using Markov Chain Monte Carlo for a range of specified latent space dimensions.

**Usage**

```
bmds(
  D,
  min_p = 1,
  max_pm1 = 6,
  burnin = 0,
  nsim = 13000,
  ic = TRUE,
  verbose = TRUE
)
```

**Arguments**

D	Observed dissimilarities (provided as a distance matrix).
min_p	A length-one numeric vector providing the minimum value of the latent space dimension to use.
max_pm1	A length-one numeric vector providing the maximum value of the latent space dimension to use (minus 1).
burnin	A length-one numeric vector providing the number of iterations to use for burnin.
nsim	A length-one numeric vector providing the number of iterations to use in the MCMC simulation after burnin.
ic	Logical scalar. If TRUE computes the MDS information criterion (MDSIC) for all solution requested.
verbose	Logical scalar. If TRUE prints information regarding the evolution of the simulation.

**Value**

A list with the following elements:

- x.chain MCMC chain of the latent configuration coordinates.
- sigma.chain MCMC chain of the random error.
- lambda.chain MCMC chain of the latent configuration variances.
- stress Numeric vector of the stress function values.
- mdsIC List with two elements, the MDSIC and BIC values for the required solutions.
- accept Numeric matrix of acceptance rates.

**bmds\_get\_x\_mode**

*Posterior mode latent configuration in Bayesian multidimensional scaling (BMDS).*

## Description

`bmds_get_x_mode` returns the latent configuration that produced the largest posterior value during the MCMC.

## Usage

```
bmds_get_x_mode(D, res, p.i, min_p, max_p, start, end)
```

## Arguments

D	Observed dissimilarities (provided as a distance matrix).
res	Results of a BMDS analysis as obtained with the <code>bmds</code> function.
p.i	A length-one numeric vector providing the index of the solution to use.
min_p	A length-one numeric vector providing the minimum value of the latent space dimension to use.
max_p	A length-one numeric vector providing the maximum value of the latent space dimension to use.
start	A length-one numeric vector providing the iteration number to start from.
end	A length-one numeric vector providing the iteration number where to end.

## Value

A real matrix containing the posterior mode latent configuration.

## Author(s)

Sergio Venturini <sergio.venturini@unito.it>

**See Also**

par(opar)

## End(Not run)
```

## Description

`check_list_na()` compares two lists and fills in the missing elements in the first with those included in the second. The comparison is recursive in the sense that the process is repeated for all lists included in those given.

## Usage

```
check_list_na(orig, des)
```

## Arguments

- |                   |  |
|-------------------|--|
| <code>orig</code> | A list whose content must be checked.                          |
| <code>des</code>  | A list to use as a reference with which compare the first one. |

## Value

A list with all elements added.

## Author(s)

Sergio Venturini <[sergio.venturini@unito.it](mailto:sergio.venturini@unito.it)>

## Examples

```
G <- 5
prior <- list(eta = list(a = rep(1, G), b = rep(2, G)))
check_list_na(prior, dmbc_prior())
```

## clusters,dmbc\_config-method

*Extract the final cluster memberships from a `dmbc_config` class instance.*

## Description

Extract the final cluster memberships from a `dmbc_config` class instance.

## Usage

```
## S4 method for signature 'dmbc_config'
clusters(object, newdata = NULL, ...)
```

## Arguments

- |                      |   |
|----------------------|---|
| <code>object</code>  | An object of class <code>dmbc_config</code> .               |
| <code>newdata</code> | An object of no explicit specification (currently ignored). |
| <code>...</code>     | Further arguments to pass on (currently ignored).           |

---

comp\_ss

*Sum of squared residuals (SSR) from the observed distances and the given latent configuration.*

---

**Description**

comp\_ss computes the sum of squared residuals (SSR) from the observed distances (diss) and the given latent coordinates (x).

**Usage**

```
comp_ss(x, diss)
```

**Arguments**

x	Real matrix containing the latent configuration.
diss	Observed dissimilarities (provided as a distance matrix).

**Value**

A length-one numeric vector providing the SSR for its arguments.

**Author(s)**

Sergio Venturini <sergio.venturini@unito.it>

**See Also**

[bmds](#) for (one-way) Bayesian (metric) multidimensional scaling.

**Examples**

```
n <- 10000
nr <- 200
nc <- floor(n/nr)
x <- matrix(rnorm(1:n), nrow = nr, ncol = nc)
obsdiss <- dist(x)
ssr <- numeric(ncol(x))
for (i in 1:ncol(x)) {
  ssr[i] <- comp_ss(x[, 1:i], obsdiss)
}
plot(ssr, xlab = "number of dimensions", ylab = "SSR", type = "b")
```

---

<code>dmhc</code>	<i>Estimation of a DMBC model.</i>
-------------------	------------------------------------

---

## Description

`dmhc()`, the main function of the package, estimates a DMBC model for a given set of  $S$  dissimilarity matrices.

## Usage

```
dmhc(
  data,
  p = 2,
  G = 3,
  control = dmhc_control(),
  prior = NULL,
  cl = NULL,
  post_all = FALSE
)
```

## Arguments

<code>data</code>	An object of class <code>dmhc_data</code> containing the data to analyze.
<code>p</code>	A length-one numeric vector indicating the number of dimensions of the latent space.
<code>G</code>	A length-one numeric vector indicating the number of cluster to partition the $S$ subjects.
<code>control</code>	A list of control parameters that affect the sampling but do not affect the posterior distribution. See <code>dmhc_control()</code> for more details.
<code>prior</code>	A list containing the prior hyperparameters. See <code>dmhc_prior()</code> for more details.
<code>cl</code>	An optional <b>parallel</b> or <b>snow</b> cluster for use if <code>parallel = "snow"</code> . If not supplied, a cluster on the local machine is created for the duration of the <code>dmhc()</code> call.
<code>post_all</code>	A length-one logical vector, which if TRUE applies a further post-processing to the simulated chains (in case these are more than one).

## Value

A `dmhc_fit_list` object.

## Author(s)

<code>dmvc_check_groups</code>	<i>Auxiliary function for checking the grouping results of a fitted DMBC model.</i>
--------------------------------	---

---

## Description

`dmvc_check_groups()` is an auxiliary function for checking whether the cluster membership estimates provided by the individual chains of the fitted model provided agree or not.

## Usage

```
dmvc_check_groups(res, est = "mean")
```

## Arguments

- |                  |  |
|------------------|--|
| <code>res</code> | An object of class <code>dmvc_fit_list</code> .                    |
| <code>est</code> | A length-one character vector indicating the estimate type to use. |

## Value

A length-one logical vector, which is equal to TRUE if all simulated chains provide the same cluster membership estimates, and FALSE otherwise.

## Author(s)

Sergio Venturini <sergio.venturini@unito.it>

## References

dmhc_config-class	<i>An S4 class to represent the latent configuration estimate for a DMHC model.</i>
-------------------	---

## Description

An S4 class to represent the the latent configuration estimate for a DMHC model.

## Slots

- `z.est` An array containing the estimate of the latent configuration for a DMHC model.
- `z.sd` An array containing the standard deviation of the latent configuration for a DMHC model.
- `cluster` A numeric vector providing the estimated group membership for the  $S$  subjects in the data.
- `est` A length-one character vector providing the estimate type returned in `z.est`. Possible values are `mean` (posterior mean), `median` (posterior median), `ml` (maximum likelihood) and `map` (maximum-a-posteriori).
- `n` A length-one numeric vector providing the number of objects.
- `p` A length-one numeric vector providing the number of latent dimensions.
- `S` A length-one numeric vector providing the number of subjects.
- `G` A length-one numeric vector providing the number of clusters.
- `family` An object of class `list`; named list with elements representing the parameter estimates corresponding to different values of  $p$  and  $G$ .
- `chain` A length-one numeric vector representing the ID of the MCMC chain used to compute the estimates.
- `labels` A character vector for the (optional) strings to use in the plots for labeling the objects.

**dmhc\_control**

*Auxiliary Function for Controlling DMHC Model Fitting*

## Description

`dmhc_control()` is an auxiliary function as user interface for `dmhc()` fitting. Typically only used when calling the `dmhc()` function. It is used to set parameters that affect the sampling but do not affect the posterior distribution.

`control_dmhc()` is an alias for `dmhc_control()`.

`check_control()` is an auxiliary function that verifies the correctness of the controls provided before a DMHC is fitted with `dmhc()`.

## Usage

```
dmhc_control(
  nsim = 5000,
  burnin = 10000,
  thin = 1,
  nchains = 1,
  threads = 1,
  seed = NULL,
  parallel = "no",
  z.prop = 1.5,
  alpha.prop = 0.75,
  random.start = TRUE,
  partition = NULL,
  method = "manhattan",
  procrustes = TRUE,
  relabel = TRUE,
  store.burnin = TRUE,
  verbose = FALSE
)

control_dmhc(
  nsim = 5000,
  burnin = 10000,
  thin = 1,
  nchains = 1,
  threads = 1,
  seed = NULL,
  parallel = "no",
  z.prop = 1.5,
```

```

alpha.prop = 0.75,
random.start = TRUE,
partition = NULL,
method = "manhattan",
procrustes = TRUE,
relabel = TRUE,
store.burnin = TRUE,
verbose = FALSE
)
check_control(control)

```

## Arguments

<code>nsim</code>	A length-one numeric vector for the number of draws to be taken from the posterior distribution.
<code>burnin</code>	A length-one numeric vector for the number of initial MCMC iterations (usually to be discarded).
<code>thin</code>	A length-one numeric vector for the number of iterations between consecutive draws.
<code>nchains</code>	A length-one numeric vector for the number of parallel chains to run.
<code>threads</code>	A length-one numeric vector for the number of chains to run. If greater than 1, package <b>parallel</b> is used to take advantage of any multiprocessing or distributed computing capabilities that may be available.
<code>seed</code>	An integer scalar. If supplied, provides the random number seed.
<code>parallel</code>	A length-one character vector indicating the type of parallel operation to be used (if any). Possible values are <code>multicore</code> (which works only on Unix/mcOS), <code>snow</code> and <code>no</code> (i.e. serial instead of parallel computing).
<code>z.prop</code>	A length-one numeric vector providing the standard deviation of the proposal distribution for the jump in the individual latent space position.
<code>alpha.prop</code>	A length-one numeric vector providing the standard deviation of the proposal distribution for the jump in the individual random effect value.
<code>random.start</code>	A length-one logical vector. If <code>TRUE</code> the starting values are drawn randomly, otherwise a user-defined starting partition must be provided through the <code>partition</code> argument.
<code>partition</code>	A length-one numeric vector providing the user-defined starting partition.
<code>method</code>	A length-one character vector that specifies the distance measure to use in determining the initial partition. Allowed values are those from the <code>dist()</code> function.
<code>procrustes</code>	A length-one logical vector. If <code>TRUE</code> the simulated MCMC chains are post-processed through a Procrustes transformation.
<code>relabel</code>	A length-one logical vector. If <code>TRUE</code> the simulated MCMC chains are relabelled to address the label-switching problem.
<code>store.burnin</code>	A logical scalar. If <code>TRUE</code> , the samples from the burnin are also stored and returned.

verbose	A logical scalar. If TRUE, causes information to be printed out about the progress of the fitting.
control	A list of control options.

**Value**

A named list with the control options as components.

**Author(s)**

Sergio Venturini <sergio.venturini@unito.it>

**See Also**

[dmvc\(\)](#)

**Examples**

```
## Not run:
data(simdiss, package = "dmvc")
# Shorter run than default.
sim.fit <- dmvc(simdiss,
  control = dmvc_control(burnin = 1000, nsim = 2000, thin = 5, verbose = TRUE))

## End(Not run)
```

*dmvc\_data-class*

*An S4 class to represent the data to use in a DMBC model.*

**Description**

An S4 class to represent the data to use in a DMBC model.

**Slots**

diss	A list whose elements are the dissimilarity matrices corresponding to the judgments expressed by the $S$ subjects/raters. These matrices must be defined as a <i>dist</i> object.
n	A length-one character vector representing the number of objects compared by each subject.
S	A length-one numeric vector representing the number of subjects.
family	A length-one character vector representing the type of data to analyze. Currently, it accepts only the 'binomial' value, but future developments will include the possibility to analyze continuous, multinomial and count data.

**Author(s)**

Sergio Venturini <sergio.venturini@unito.it>

## References

Venturini, S., Piccarreta, R. (2019), "A Bayesian Approach for Model-Based Clustering of Several Binary Dissimilarity Matrices: the **dmvc** Package in R", Technical report.

## Examples

```
showClass("dmvc_data")
```

**dmvc\_fit**

*Fitter function for DMBC models.*

## Description

`dmvc_fit()` is the main function that estimates a DMBC model.

## Usage

```
dmvc_fit(D, p, G, family, control, prior, start)
```

## Arguments

D	A list whose elements are the dissimilarity matrices corresponding to the judgments expressed by the $S$ subjects/raters. These matrices must be defined as a <code>dist</code> object.
p	A length-one numeric vector indicating the number of dimensions of the latent space.
G	A length-one numeric vector indicating the number of cluster to partition the $S$ subjects.
family	A length-one character vector representing the type of data to analyze. Currently, it accepts only the 'binomial' value, but future developments will include the possibility to analyze continuous, multinomial and count data.
control	A list of control parameters that affect the sampling but do not affect the posterior distribution See <code>dmvc_control()</code> for more details.
prior	A list containing the prior hyperparameters. See <code>dmvc_prior()</code> for more details.
start	A named list of starting values for the MCMC algorithm (see <code>dmvc_init</code> ).

## Value

A `dmvc_fit_list` object.

## Author(s)

Sergio Venturini <sergio.venturini@unito.it>

## End(Not run)
```

## Description

An S4 class to represent the results of fitting DMBC model using a single Markov Chain Monte Carlo chain.

## Slots

- `z.chain` An object of class `array`; posterior draws from the MCMC algorithm for the (untransformed) latent configuration  $Z$ .
- `z.chain.p` An object of class `array`; posterior draws from the MCMC algorithm for the (Procrustes-transformed) latent configuration  $Z$ .
- `alpha.chain` An object of class `matrix`; posterior draws from the MCMC algorithm for the  $\alpha$  parameters.
- `eta.chain` An object of class `matrix`; posterior draws from the MCMC algorithm for the  $\eta$  parameters.
- `sigma2.chain` An object of class `matrix`; posterior draws from the MCMC algorithm for the  $\sigma^2$  parameters.
- `lambda.chain` An object of class `matrix`; posterior draws from the MCMC algorithm for the  $\lambda$  parameters.
- `prob.chain` An object of class `array`; posterior draws from the MCMC algorithm for the cluster membership probabilities.
- `x.ind.chain` An object of class `array`; posterior draws from the MCMC algorithm for the cluster membership indicators.
- `x.chain` An object of class `matrix`; posterior draws from the MCMC algorithm for the cluster membership labels.
- `accept` An object of class `matrix`; final acceptance rates for the MCMC algorithm.
- `diss` An object of class `list`; list of observed dissimilarity matrices.
- `dens` An object of class `list`; list of log-likelihood, log-prior and log-posterior values at each iteration of the MCMC simulation.
- `control` An object of class `list`; list of the control parameters (number of burnin and sample iterations, number of MCMC chains, etc.). See `dmvc_control()` for more information.
- `prior` An object of class `list`; list of the prior hyperparameters. See `dmvc_prior()` for more information.
- `dim` An object of class `list`; list of dimensions for the estimated model, i.e. number of objects ( $n$ ), number of latent dimensions ( $p$ ), number of clusters ( $G$ ), and number of subjects ( $S$ ).
- `model` An object of class `dmvc_model`.

**dmvc\_fit\_list\_to\_list** *Conversion of an dmvc\_fit\_list object to a list.*

## Description

`dmvc_fit_list_to_list` converts an object of class `dmvc_fit_list` to a list of arrays including all the parameter. chains. It is intended for internal use mainly.

## Usage

```
dmvc_fit_list_to_list(res, include.burnin = FALSE, verbose = TRUE)
```

## Arguments

- res**                An object of type `dmvc_fit_list`.
- include.burnin**    A logical scalar. If TRUE the burnin iterations (if available) are not removed.
- verbose**            A logical scalar. If TRUE prints additional warnings during the conversion.

**Value**

An object of type `mcmc.list`.

**dmbc\_get\_map***Extractor function for a fitted DMBC model.*

## Description

`dmbc_get_map()` is an extractor function for extracting the maximum-a-posterior estimates of the parameters for a fitted DMBC model.

## Usage

```
dmbc_get_map(res, chain = 1)
```

## Arguments

- |                    |  |
|--------------------|--|
| <code>res</code>   | An object of class <code>dmbc_fit_list</code> .                      |
| <code>chain</code> | A length-one numeric vector indicating the MCMC chain number to use. |

## Value

A named list with the following elements:

- `z`: array of latent coordinates posterior mean estimates
- `alpha`: numeric vector of alpha posterior mean estimates
- `eta`: numeric vector of eta posterior mean estimates
- `sigma2`: numeric vector of sigma2 posterior mean estimates
- `lambda`: numeric vector of lambda posterior mean estimates
- `prob`: numeric matrix of probability posterior mean estimates
- `cluster`: numeric vector of cluster membership posterior mean estimates
- `logpost`: length-one numeric vector of the maximum log-posterior value
- `chain`: length-one numeric vector of the MCMC chain number used

| <code>res</code>   | An object of class <code>dmvc_fit_list</code> .                      |
| <code>chain</code> | A length-one numeric vector indicating the MCMC chain number to use. |

## Value

A named list with the following elements:

- `z`: array of latent coordinates posterior mean estimates
- `alpha`: numeric vector of alpha posterior mean estimates
- `eta`: numeric vector of eta posterior mean estimates
- `sigma2`: numeric vector of sigma2 posterior mean estimates
- `lambda`: numeric vector of lambda posterior mean estimates
- `prob`: numeric matrix of probability posterior mean estimates
- `cluster`: numeric vector of cluster membership posterior mean estimates
- `chain`: length-one numeric vector of the MCMC chain number used

## End(Not run)

```

**dmvc\_get\_postmedian**    *Extractor function for a fitted DMVC model.*

## Description

`dmvc_get_postmedian()` is an extractor function for extracting the posterior median estimates of the parameters for a fitted DMVC model.

## Usage

```
dmvc_get_postmedian(res, chain = 1)
```

## Arguments

- |                    |  |
|--------------------|--|
| <code>res</code>   | An object of class <code>dmvc_fit_list</code> .                      |
| <code>chain</code> | A length-one numeric vector indicating the MCMC chain number to use. |

## Value

A named list with the following elements:

- `z:` array of latent coordinates posterior median estimates
- `alpha:` numeric vector of alpha posterior median estimates
- `eta:` numeric vector of eta posterior median estimates
- `sigma2:` numeric vector of sigma2 posterior median estimates

**lambda:** numeric vector of lambda posterior median estimates  
**prob:** numeric matrix of probability posterior median estimates  
**cluster:** numeric vector of cluster membership posterior median estimates  
**chain:** length-one numeric vector of the MCMC chain number used

---

**dmbc\_IC***Model selection of DMBC models.*

---

## Description

`dmbc_IC()` is the main function for simultaneously selecting the optimal latent space dimension ( $p$ ) and number of clusters ( $G$ ) for a DMBC analysis.

## Usage

```
dmbc_IC(
  data,
  pmax = 3,
  Gmax = 5,
  control = dmbc_control(),
  prior = NULL,
  est = "mean"
)
```

## Arguments

<code>data</code>	An object of class <code>dmbc_data</code> containing the data to analyze.
<code>pmax</code>	A length-one numeric vector indicating the maximum number of dimensions of the latent space to consider.
<code>Gmax</code>	A length-one numeric vector indicating the maximum number of cluster to consider.
<code>control</code>	A list of control parameters that affect the sampling but do not affect the posterior distribution See <code>dmbc_control()</code> for more details.
<code>prior</code>	A list containing the prior hyperparameters. See <code>dmbc_prior()</code> for more details.
<code>est</code>	A length-one character vector indicating the estimate type to use. Possible values are <code>mean</code> , <code>median</code> , <code>ml</code> and <code>map</code> .

## Value

A `dmbc_ic` object.

## Author(s)

Sergio Venturini <[sergio.venturini@unito.it](mailto:sergio.venturini@unito.it)>

# plot the results
library(bayesplot)
library(ggplot2)
color_scheme_set("mix-yellow-blue")
p <- plot(new.ic, size = c(4, 1.5))
p + panel_bg(fill = "gray90", color = NA)

## End(Not run)
```

**Description**

An S4 class to represent the comparison of a set of DMBC models through the dissimilarity model-based clustering information criterion (DCIC).

## Slots

- `logprior` An object of class `matrix` providing the log-prior values corresponding to different values of  $p$  and  $G$ .
- `logmllik` An object of class `matrix` providing the marginal log-likelihood values corresponding to different values of  $p$  and  $G$ .
- `logcorrfact` An object of class `matrix` providing the logarithm of the correction factors corresponding to different values of  $p$  and  $G$ .
- `DCIC` An object of class `matrix` providing the values of the DCIC index corresponding to different values of  $p$  and  $G$ .
- `post.est` An object of class `list`; named list with elements representing the parameter estimates corresponding to different values of  $p$  and  $G$ .
- `est` A length-one character vector representing the estimate type used in computing the DCIC index. Possible values are `mean`, `median`, `m1` and `map`. See `dmbc_ic()` for more details about these values.
- `res_last_p` An object of class `list`; list of `dmbc_fit_list` objects with the results of fitting the DMBC models corresponding to the last value of  $p$ . This is needed in case of an update of the DCIC calculations using additional  $p$  and/or  $G$  values.

```

`dmbc_init`

*Function to compute the starting values before fitting a DMBC models.*

## Description

`dmbc_init()` is the main function that estimates a DMBC model.

## Usage

```
dmbc_init(D, p, G, family, random.start, method, partition)
```

## Arguments

D	A list whose elements are the dissimilarity matrices corresponding to the judgments expressed by the $S$ subjects/raters. These matrices must be defined as a <code>dist</code> object.
p	A length-one numeric vector indicating the number of dimensions of the latent space.
G	A length-one numeric vector indicating the number of cluster to partition the $S$ subjects.
family	A length-one character vector representing the type of data to analyze. Currently, it accepts only the 'binomial' value, but future developments will include the possibility to analyze continuous, multinomial and count data.
random.start	A length-one logical vector. If TRUE the starting values are drawn randomly, otherwise.
method	A length-one character vector specifying the distance measure to use in determining the initial partition. Allowed values are those from the <code>dist()</code> function.
partition	A length-one numeric vector providing the user-defined starting partition.

## Value

A named list with the following items:

- z: array of latent coordinates starting values
- x: numeric vector of initial cluster memberships
- ng: numeric vector of initial cluster sizes
- alpha: numeric vector of alpha starting values
- eta: numeric vector of eta starting values
- sigma2: numeric vector of sigma2 starting values
- lambda: numeric vector of lambda starting values

data(simdiss, package = "dmhc")
dmhc_init(simdiss@diss, p = 2, G = 3, family = "binomial", random.start = TRUE)
```

---

dmbc\_logLik *Log-likelihood for DMBC models.*

---

## Description

dmbc\_logLik() computes the log-likelihood value for a DMBC model.

## Usage

```
dmbc_logLik(D, Z, alpha, lambda, x)
```

## Arguments

D	A list whose elements are the dissimilarity matrices corresponding to the judgments expressed by the S subjects/raters. These matrices must be defined as a dist object.
Z	A numeric matrix containing the latent configuration.
alpha	A numeric vector containing the alpha values.
lambda	A numeric vector containing the alpha lambda.
x	A numeric vector containing the cluster indicator values.

## Value

A length-one numeric vector of the log-likelihood value.

## Author(s)

Sergio Venturini <sergio.venturini@unito.it>

---

**dmbc\_logLik\_rbmds**      *Log-likelihood for DMBC models.*

---

## Description

`dmbc_logLik_rbmds()` computes the log-likelihood value for a DMBC model.

## Usage

```
dmbc_logLik_rbmds(D, Z, alpha)
```

## Arguments

- D      A list whose elements are the dissimilarity matrices corresponding to the judgments expressed by the  $S$  subjects/raters. These matrices must be defined as a `dist` object.
- Z      A numeric matrix containing the latent configuration.
- alpha      A numeric vector containing the alpha values.

## Value

dmbc_match_groups	<i>Auxiliary function for realigning the grouping of a fitted DMBC model.</i>
-------------------	---

---

## Description

`dmbc_match_groups()` is an auxiliary function for realigning the cluster membership estimates provided by the individual chains of the fitted model if they do not agree.

## Usage

```
dmbc_match_groups(res, est = "mean", ref = 1)
```

## Arguments

- `res` An object of class `dmbc_fit_list`.
- `est` A length-one character vector indicating the estimate type to use.
- `ref` A length-one numeric vector indicating the chain number to use as the reference.

## Value

An object of class `dmbc_fit_list`.

```

---

dmhc\_priorAuxiliary Function for Setting DMBC Model Priors

---

## Description

`dmhc_prior()` is an auxiliary function as user interface for `dmhc()` fitting. Typically only used when calling the `dmhc()` function. It is used to set prior hyperparameters.

`prior_dmhc()` is an alias for `dmhc_prior()`.

`check_prior()` is an auxiliary function that verifies the correctness of the prior hyperparameters provided before a DMBC is fitted with `dmhc()`.

`update_prior()` is an auxiliary function to modify a set of prior choices using a new value of  $p$  and  $G$ . It is intended for internal use mainly in the `dmhc_ic()` function.

## Usage

```
dmhc_prior(
  eta = list(a = rep(1.5, .dmhcEnv$current_G), b = rep(0.5, .dmhcEnv$current_G)),
  sigma2 = list(a = 0.1, b = 0.1),
  lambda = rep(1, .dmhcEnv$current_G)
)

prior_dmhc(
  eta = list(a = rep(1.5, .dmhcEnv$current_G), b = rep(0.5, .dmhcEnv$current_G)),
  sigma2 = list(a = 0.1, b = 0.1),
  lambda = rep(1, .dmhcEnv$current_G)
)

check_prior(prior)

update_prior(prior, p, G)
```

## Arguments

<code>eta</code>	A named list containing the hyperparameters for the prior distribution of the $\eta_1, \dots, \eta_G$ parameters. It should contain two numeric vectors, namely <code>a</code> and <code>b</code> .
<code>sigma2</code>	A named list containing the hyperparameters for the prior distributions of the $\sigma_1^2, \dots, \sigma_G^2$ parameters. It should contain two numeric scalars, namely <code>a</code> and <code>b</code> .
<code>lambda</code>	A list containing the hyperparameters for the prior distribution of the $\lambda_1, \dots, \lambda_G$ parameters. It should contain a single numeric vector.
<code>prior</code>	A named list of prior hyperparameters.
<code>p</code>	A length-one numeric vector indicating the number of dimensions of the latent space.
<code>G</code>	A length-one numeric vector indicating the number of cluster to partition the $S$ subjects.

**Value**

A list with the prior hyperparameters as components.

**Author(s)**

Sergio Venturini <sergio.venturini@unito.it>

**See Also**

[dmhc\(\)](#)

**Examples**

```
## Not run:
data(simdiss, package = "dmhc")
# Shorter run than default.
sim.fit <- dmhc(simdiss,
control = dmhc_control(burnin = 1000, nsim = 2000, thin = 1, verbose = TRUE),
prior = dmhc_prior(sigma2 = list(a = 1, b = 4)))

## End(Not run)
```

**initialize,dmhc\_config-method**

*Create an instance of the dmhc\_config class using new/initialize.*

**Description**

Create an instance of the dmhc\_config class using new/initialize.

**Usage**

```
## S4 method for signature 'dmhc_config'
initialize(
  .Object,
  Z.est = array(),
  Z.sd = array(),
  cluster = numeric(),
  est = character(),
  n = numeric(),
  S = numeric(),
  p = numeric(),
  G = numeric(),
  family = character(),
  chain = numeric(),
  labels = character()
)
```

## Arguments

.Object	Prototype object from the class <a href="#">dmhc_config</a> .
Z.est	An array containing the estimate of the latent configuration for a DMBC model.
Z.sd	An array containing the standard deviation of the latent configuration for a DMBC model.
cluster	A numeric vector providing the estimated group membership for the $S$ subjects in the data.
est	A length-one character vector providing the estimate type returned in Z.est. Possible values are mean (posterior mean), median (posterior median), ml (maximum likelihood) and map (maximum-a-posteriori).
n	A length-one numeric vector providing the number of objects.
S	A length-one numeric vector providing the number of subjects.
p	A length-one numeric vector providing the number of latent dimensions.
G	A length-one numeric vector providing the number of clusters.
family	An object of class list; named list with elements representing the parameter estimates corresponding to different values of $p$ and $G$ .
chain	A length-one numeric vector representing the ID of the MCMC chain used to compute the estimates.
labels	A character vector for the (optional) strings to use in the plots for labeling the objects.

### initialize,dmhc\_data-method

*Create an instance of the dmhc\_data class using new/initialize.*

## Description

Create an instance of the dmhc\_data class using new/initialize.

## Usage

```
## S4 method for signature 'dmhc_data'
initialize(
  .Object,
  diss = list(),
  n = numeric(),
  S = numeric(),
  family = character()
)
```

**Arguments**

.Object	Prototype object from the class <a href="#">dmhc_data</a> .
diss	A list whose elements are the dissimilarity matrices corresponding to the judgments expressed by the $S$ subjects/raters. These matrices must be defined as a <code>dist</code> object.
n	A length-one character vector representing the number of objects compared by each subject.
S	A length-one numeric vector representing the number of subjects.
family	A length-one character vector representing the type of data to analyze. Currently, it accepts only the 'binomial' value, but future developments will include the possibility to analyze continuous, multinomial and count data.

**Author(s)**

Sergio Venturini <[sergio.venturini@unito.it](mailto:sergio.venturini@unito.it)>

**initialize,dmhc\_fit-method**

*Create an instance of the dmhc\_fit class using new/initialize.*

**Description**

Create an instance of the `dmhc_fit` class using `new/initialize`.

**Usage**

```
## S4 method for signature 'dmhc_fit'
initialize(
  .Object,
  z.chain = array(),
  z.chain.p = array(),
  alpha.chain = matrix(),
  eta.chain = matrix(),
  sigma2.chain = matrix(),
  lambda.chain = matrix(),
  prob.chain = array(),
  x.ind.chain = array(),
  x.chain = matrix(),
  accept = matrix(),
  diss = list(),
  dens = list(),
  control = list(),
  prior = list(),
  dim = list(),
  model = NA
)
```

## Arguments

.Object	Prototype object from the class <a href="#">dmbc_fit</a> .
z.chain	An object of class <code>array</code> ; posterior draws from the MCMC algorithm for the (untransformed) latent configuration $Z$ .
z.chain.p	An object of class <code>array</code> ; posterior draws from the MCMC algorithm for the (Procrustes-transformed) latent configuration $Z$ .
alpha.chain	An object of class <code>matrix</code> ; posterior draws from the MCMC algorithm for the $\alpha$ parameters.
eta.chain	An object of class <code>matrix</code> ; posterior draws from the MCMC algorithm for the $\eta$ parameters.
sigma2.chain	An object of class <code>matrix</code> ; posterior draws from the MCMC algorithm for the $\sigma^2$ parameters.
lambda.chain	An object of class <code>matrix</code> ; posterior draws from the MCMC algorithm for the $\lambda$ parameters.
prob.chain	An object of class <code>array</code> ; posterior draws from the MCMC algorithm for the cluster membership probabilities.
x.ind.chain	An object of class <code>array</code> ; posterior draws from the MCMC algorithm for the cluster membership indicators.
x.chain	An object of class <code>matrix</code> ; posterior draws from the MCMC algorithm for the cluster membership labels.
accept	An object of class <code>matrix</code> ; final acceptance rates for the MCMC algorithm.
diss	An object of class <code>list</code> ; list of observed dissimilarity matrices.
dens	An object of class <code>list</code> ; list of log-likelihood, log-prior and log-posterior values at each iteration of the MCMC simulation.
control	An object of class <code>list</code> ; list of the control parameters (number of burnin and sample iterations, number of MCMC chains, etc.). See <a href="#">dmbc_control()</a> for more information.
prior	An object of class <code>list</code> ; list of the prior hyperparameters. See <a href="#">dmbc_prior()</a> for more information.
dim	An object of class <code>list</code> ; list of dimensions for the estimated model, i.e. number of objects ( $n$ ), number of latent dimensions ( $p$ ), number of clusters ( $G$ ), and number of subjects ( $S$ ).
model	An object of class <a href="#">dmbc_model</a> .

Create an instance of the dmbc\_ic class using new/initialize.

**Usage**

```
## S4 method for signature 'dmbc_ic'
initialize(
  .Object,
  logprior = matrix(),
  logmlik = matrix(),
  logcorrfact = matrix(),
  DCIC = matrix(),
  post.est = list(),
  est = character(),
  res_last_p = list()
)
```

**Arguments**

.Object	Prototype object from the class <a href="#">dmhc_ic</a> .
logprior	An object of class <code>matrix</code> providing the log-prior values corresponding to different values of $p$ and $G$ .
logmlik	An object of class <code>matrix</code> providing the marginal log-likelihood values corresponding to different values of $p$ and $G$ .
logcorrfact	An object of class <code>matrix</code> providing the logarithm of the correction factors corresponding to different values of $p$ and $G$ .
DCIC	An object of class <code>matrix</code> providing the values of the DCIC index corresponding to different values of $p$ and $G$ .
post.est	An object of class <code>list</code> ; named list with elements representing the parameter estimates corresponding to different values of $p$ and $G$ .
est	A length-one character vector representing the estimate type used in computing the DCIC index. Possible values are <code>mean</code> , <code>median</code> , <code>ml</code> and <code>map</code> . See <a href="#">dmhc_ic()</a> for more details about these values.
res_last_p	An object of class <code>list</code> ; list of <code>dmhc_fit_list</code> objects with the results of fitting the DMBC models corresponding to the last value of $p$ . This is needed in case of an update of the DCIC calculations using additional $p$ and/or $G$ values.

**initialize,dmhc\_model-method**

*Create an instance of the dmhc\_model class using new/initialize.*

**Description**

Create an instance of the `dmhc_model` class using `new/initialize`.

**Usage**

```
## S4 method for signature 'dmhc_model'
initialize(.Object, p = numeric(), G = numeric(), family = character())
```

**Arguments**

.Object	Prototype object from the class <a href="#">dmhc_model</a> .
p	A length-one character vector representing the number of dimensions of the latent space to use in the MDS analysis.
G	A length-one numeric vector representing the number of clusters to partition the subjects into.
family	A length-one character vector representing the type of data to analyze. Currently, it accepts only the 'binomial' value, but future developments will include the possibility to analyze continuous, multinomial and count data.

**Author(s)**

Sergio Venturini <sergio.venturini@unito.it>

**kinship**

*List of binary dissimilarity matrices among 15 kinship terms.*

**Description**

Rosenberg and Kim (1975) designed an experiment to analyze the perceived similarities of 15 kinship terms.

Here, we consider the data relative to 85 females made available in Rosenberg (1982). Each subject was asked to group the kinship terms according to the perceived similarity. Thus,  $S = 85$  binary dissimilarity matrices are available whose elements (0 or 1) indicate whether or not two kinship terms were grouped together by each individual.

**Usage**

```
data(kinship)
```

**Format**

A **dmbc\_data** object whose **diss** element is a list of 85 binary dissimilarity matrices. Each matrix is defined as a **dist** object measuring whether each pair of the 15 kinship terms is judged as similar (1) or not (0).

The **dist** objects have rows and columns that are named as follows:

- GrF** grandfather
- GrM** grandmother
- GrD** granddaughter
- GrS** grandson
- Bro** brother
- Sis** sister
- Fat** father
- Mot** mother
- Dau** daughter
- Son** son
- Nep** nephew
- Nie** niece
- Cou** cousin
- Aun** aunt
- Unc** uncle

- Rosenberg, S., Kim, M. P. (1975). The method of sorting as a data-gathering procedure in multivariate research. *Multivariate Behavioral Research*, 10.

## Examples

```
data(kinship)
library(bayesplot)
cols <- color_scheme_set("mix-red-blue")
plot(kinship, colors = unlist(cols)[c(1, 6)], font = 1, cex.font = 0.75)
```

**mdsic**

*Information criterion for Bayesian multidimensional scaling (BMDS).*

## Description

**mdsic** computes the information criterion for a set of Bayesian multidimensional scaling (BMDS) solutions using the approach in Oh & Raftery (2001).

## Usage

```
mdsic(x_star, rmin_ssrr, n, min_p = 1, max_p = 6)
```

## Arguments

- |                  |   |
|------------------|---|
| <b>x_star</b>    | An array containing the latent configurations estimated using <a href="#">bmds</a> .          |
| <b>rmin_ssrr</b> | A numeric vector providing the ratios of SSR for the latent dimensions requested.             |
| <b>n</b>         | A length-one numeric vector providing the number of objects.                                  |
| <b>min_p</b>     | A length-one numeric vector providing the minimum value of the latent space dimension to use. |
| <b>max_p</b>     | A length-one numeric vector providing the maximum value of the latent space dimension to use. |

## Value

A list with the following elements:

- mdsic** A numeric vector with the values of MDSIC index.
- bic** A numeric vector with the values of the BIC index.

## Examples

```
## Not run:
# Road distances (in km) between 21 cities in Europe
data(eurodist, package = "datasets")

min_p <- 1
max_p <- 10
burnin <- 200
nsim <- 1000
totiter <- burnin + nsim

eurodist.mds <- cmdscale(eurodist, max_p)
eurodist.bmds <- bmds(eurodist, min_p, max_p, burnin, nsim)

plot((min_p:max_p), eurodist.bmds$mdsic, type = "b",
     main = "MDS Information Criterion", xlab = "p", ylab = "MDSIC")
MDSICmin <- which.min(eurodist.bmds$mdsic)
points((min_p:max_p)[MDSICmin], eurodist.bmds$mdsic[MDSICmin],
       col = "red", pch = 10, cex = 1.75, lwd = 1.5)

## End(Not run)
```

**plot,dmhc\_config,ANY-method**

*Provide a graphical summary of a dmhc\_config class instance.*

## Description

Provide a graphical summary of a dmhc\_config class instance.

## Usage

```
## S4 method for signature 'dmhc_config,ANY'
plot(
  x,
  size = NULL,
  size_lbl = NULL,
  nudge_x = 0,
  nudge_y = 0,
```

```

label_objects = TRUE,
...
)

```

**Arguments**

<code>x</code>	An object of class <a href="#">dmhc_config</a> .
<code>size</code>	A length-two numeric vector providing the optional sizes of points and lines in the plot.
<code>size_lbl</code>	A length-one numeric vector providing the size of labels.
<code>nudge_x</code>	A length-one numeric vector providing the optional horizontal adjustment to nudge labels by.
<code>nudge_y</code>	A length-one numeric vector providing the optional vertical adjustment to nudge labels by.
<code>label_objects</code>	A length-one logical vector. If TRUE, labels are added to the plot.
<code>...</code>	Further arguments to pass on (currently ignored).

`plot,dmhc_data,ANY-method`

*Provide a graphical summary of a dmhc\_data class instance.*

**Description**

Provide a graphical summary of a dmhc\_data class instance.

**Usage**

```
## S4 method for signature 'dmhc_data,ANY'
plot(x, colors = c("white", "black"), font = NA, cex.font = NA, ...)
```

**Arguments**

<code>x</code>	An object of class <a href="#">dmhc_data</a> .
<code>colors</code>	A character vector providing the colors to use in the plot.
<code>font</code>	A length-one numeric vector for the font to use for text. Can be a vector. NA values (the default) mean use <code>par("font")</code> .
<code>cex.font</code>	A length-one numeric vector for the character expansion factor. NULL and NA are equivalent to 1.0. This is an absolute measure, not scaled by <code>par("cex")</code> or by setting <code>'par("mfrow")</code> or <code>'par("mfcol")</code> . Can be a vector.
<code>...</code>	Further arguments to pass on (currently ignored).

**Author(s)**

Sergio Venturini <sergio.venturini@unito.it>

**Examples**

```
data(simdiss)
library(bayesplot)
cols <- color_scheme_set("brightblue")
plot(simdiss, colors = unlist(cols)[c(1, 6)], font = 1, cex.font = 0.75)
```

**plot,dmhc\_fit,ANY-method**

*Provide a graphical summary of a dmhc\_fit class instance.*

**Description**

Provide a graphical summary of a dmhc\_fit class instance.

**Usage**

```
## S4 method for signature 'dmhc_fit,ANY'
plot(
  x,
  what = "trace",
  pars = character(),
  regex_pars = "lambda",
  include.burnin = FALSE,
  combo = NULL,
  ...
)
```

**Arguments**

<code>x</code>	An object of class <a href="#">dmhc_fit</a> .
<code>what</code>	A length-one character vector providing the plot type to produce. Admissible values are those provided by the <a href="#">bayesplot</a> package, that is: acf, areas, dens, hex, hist, intervals, neff, pairs, parcoord, recover, rhat, scatter, trace, violin or combo. In particular, combo allows to mix different plot types. For more details see the documentation of the <a href="#">bayesplot</a> package, starting from <a href="#">this overview page</a> .
<code>pars</code>	An optional character vector of parameter names. If neither <code>pars</code> nor <code>regex_pars</code> is specified, the default is to use all parameters.
<code>regex_pars</code>	An optional <a href="#">regular expression</a> to use for parameter selection. Can be specified instead of <code>pars</code> or in addition to <code>pars</code> .
<code>include.burnin</code>	A length-one logical vector. If TRUE the burnin iterations (if available) are included in the summary.

combo            A character vector providing the plot types to combine (see [mcmc\\_combo](#)).  
 ...              Further arguments to pass on.
